Question **1**

Correct

Marked out of 1.00

Flag question

Given an array of integers, reverse the given array in place using an index and loop rather than a built-in function.

Example

`arr = [1, 3, 2, 4, 5]`  
Return the array `[5, 4, 2, 3, 1]` which is the reverse of the input array.

Function Description

Complete the function `reverseArray` in the editor below.

`reverseArray` has the following parameter(s):

`int arr[n]`: an array of integers

Return

`int[n]`: the array in reverse order

Constraints

$1 \leq n \leq 100$   
 $0 < arr[i] \leq 100$

Input Format For Custom Testing

The first line contains an integer, `n`, the number of elements in `arr`.

**Sample Input For Custom Testing**

5

1

3

2

4

5

**Sample Output**

5

4

2

3

1

**Explanation**

The input array is [1, 3, 2, 4, 5], so the reverse of the input array is [5, 4, 2, 3, 1].

**Sample Case 1**

**Sample Input For Custom Testing**

4

17

10

21

45

**Sample Output**

45

17

## Explanation

The input array is [17, 10, 21, 45], so the reverse of the input array is [45, 21, 10, 17].

**Answer:** (penalty regime: 0 %)

Reset answer

```
1  /*
2  * Complete the 'reverseArray' function below.
3  *
4  * The function is expected to return an INTEGER_ARRAY.
5  * The function accepts INTEGER_ARRAY arr as parameter.
6  */
7
8  /*
9  * To return the integer array from the function, you should:
10 *     - Store the size of the array to be returned in the result_
11 *     - Allocate the array statically or dynamically
12 *
13 * For example,
14 * int* return_integer_array_using_static_allocation(int* result_co
15 *     *result_count = 5;
16 *
17 *     static int a[5] = {1, 2, 3, 4, 5};
18 *
19 *     return a;
20 * }
21 *
22 * int* return_integer_array_using_dynamic_allocation(int* result_
23 *     *result_count = 5;
24 *
25 *     int *a = malloc(5 * sizeof(int));
26 *
27 *     for (int i = 0; i < 5; i++) {
28 *         *(a + i) = i + 1;
29 *     }
30 *
31 *     return a;
32 * }
```

```
35 #include<stdio.h>
36 #include<stdlib.h>
37 int* reverseArray(int arr_count, int *arr, int *result_count) {
38     int* result =(int*)malloc(arr_count * sizeof(int));
39
40     if(result ==NULL){
41         return NULL;
42     }
43     for (int i=0;i<arr_count;i++)
44     {
45         result[i]=arr[arr_count-i-1];
46     }
47     *result_count =arr_count;
48     return result;
49 }
50
51
```

	Test	Expected	Got	
✓	int arr[] = {1, 3, 2, 4, 5}; int result_count; int* result = reverseArray(5, arr, &result_count); for (int i = 0; i < result_count; i++) printf("%d\n", *(result + i));	5 4 2 3 1	5 4 2 3 1	✓

Passed all tests! ✓

Question **2**  
Correct

An automated cutting machine is used to cut rods into segments. The cutting machine can only hold a rod of *minLength* or more, and it can only make one cut at a time. Given the array *lengths[]* representing the desired lengths of each segment, determine

**Example**

$$n = 3$$

$$lengths = [4, 3, 2]$$

$$minLength = 7$$

The rod is initially  $sum(lengths) = 4 + 3 + 2 = 9$  units long. First cut off the segment of length  $4 + 3 = 7$  leaving a rod  $9 - 7 = 2$ . Then check that the length 7 rod can be cut into segments of lengths 4 and 3. Since 7 is greater than or equal to  $minLength = 7$ , the final cut can be made. Return "Possible".

**Example**

$$n = 3$$

$$lengths = [4, 2, 3]$$

$$minLength = 7$$

The rod is initially  $sum(lengths) = 4 + 2 + 3 = 9$  units long. In this case, the initial cut can be of length 4 or  $4 + 2 = 6$ . Regardless of the length of the first cut, the remaining piece will be shorter than  $minLength$ . Because  $n - 1 = 2$  cuts cannot be made, the answer is "Impossible".

**Function Description**

Complete the function *cutThemAll* in the editor below.

*int lengths[n]*: the lengths of the segments, in order

*int minLength*: the minimum length the machine can accept

Returns

string: "*Possible*" if all  $n-1$  cuts can be made. Otherwise, return the string "*Impossible*".

Constraints

- $2 \leq n \leq 10^5$
- $1 \leq t \leq 10^9$
- $1 \leq lengths[i] \leq 10^9$
- *The sum of the elements of lengths equals the uncut rod length.*

### **Input Format For Custom Testing**

The first line contains an integer,  $n$ , the number of elements in *lengths*.

Each line  $i$  of the  $n$  subsequent lines (where  $0 \leq i < n$ ) contains an integer, *lengths*[ $i$ ].

The next line contains an integer, *minLength*, the minimum length accepted by the machine.

### **Sample Case 0**

STDIN    Function

-----

4    →   lengths[] size n = 4  
3    →   lengths[] = [3, 5, 4, 3]  
5  
4  
3  
9    →   minLength= 9

**Sample Output**

Possible

**Explanation**

The uncut rod is  $3 + 5 + 4 + 3 = 15$  units long. Cut the rod into lengths of  $3 + 5 + 4 = 12$  and  $3$ . Then cut the  $12$  unit piece into lengths  $3$  and  $5 + 4 = 9$ . The remaining segment is  $5 + 4 = 9$  units and that is long enough to make the final cut.

**Sample Case 1**

**Sample Input For Custom Testing**

STDIN    Function

-----

3    →   lengths[] size n = 3

2

12 → minLength= 12

**Sample Output**

Impossible

**Explanation**

The uncut rod is  $5 + 6 + 2 = 13$  units long. After making either cut, the rod will be too short to make the second cut.

**Answer:** (penalty regime: 0 %)

Reset answer

```
1 1 /*
2 2 * Complete the 'cutThemAll' function below.
3 3 *
4 4 * The function is expected to return a STRING.
5 5 * The function accepts following parameters:
